

PATIENT CARE - PROBLEM & SOLUTION

1. Problems Identified

- Care delivery: recurring daily caregiver work must be assigned, checked, and visible so activities are not missed.
- Medication: caregivers need patient/medicine/time tracking, administration outcomes, and refusal notes.
- Staffing: 3 caregivers support 8 patients under a 1:3 policy; coverage must be monitored when a caregiver is unavailable.
- Sales: the sales team needs lead, source, stage, follow-up, conversion, and monthly performance tracking.
- Relatives & visits: maintain a relative directory linked to patients, with contact details and latitude/longitude, plus weekly visit management.
- Visit communication: relatives need weather information on their visit day using their stored location.

2. Proposed Solution

- ClickUp operations hub: Patients, recurring Daily Care tasks/checklists, Medication Administration (Scheduled -> In Progress -> Given/Refused), Sales CRM (New -> Contacted -> Reviewed -> Converted/Lost), sales views/dashboard, and Relatives + Visits (weekly scheduling and visit outcomes).
- Free-plan design: minimize Custom Field usage; use native task status, assignee, due date, linked tasks, descriptions, checklists, and views wherever possible.
- n8n weather automation: daily check of ClickUp relatives; NEW relatives become eligible at creation date + 3 days, ACTIVE weekly visitors become eligible on their due date; n8n creates a scheduled Visit, calls Open-Meteo Weather API with each relative's coordinates, and sends a personalized Gmail forecast.

3. Decisions & Assumptions

- The 22% lead-to-patient rate is treated as a historical benchmark; actual conversion is derived from CRM CONVERTED vs total leads.
- Each relative record is the ongoing visitor profile; each Visit task represents one scheduled visit and is updated by management to Visited, Cancelled, or No Show.
- A relative's latitude/longitude represents the location used for weather lookup; multiple relatives on the same day are processed individually using their own coordinates.
- The brief does not provide a complete room/bed capacity model, so no facility-capacity calculation is inferred.
- ClickUp Free-plan limitations (notably advanced dashboard cards and delegated reminders) are documented rather than worked around with unnecessary fields; stronger notifications/reporting can be automated with n8n.
